

## Bed Sores (Pressure Ulcers)

A pressure ulcer (bed sore) is a skin wound that can occur when patients are bed-ridden even for a short period of time (such as while recovering from surgery). Pressure ulcers can lead to infection. The Pressure Ulcer report will tell you how successful Minnesota hospitals are in providing high quality post-surgical care as measured by the pressure ulcer rate.

Pressure Ulcer Rate - Some hospitals may experience a greater number of patients with pressure ulcers because they see more sick patients. Our pressure ulcer rate information is shown as a comparison between a hospital's actual rate and the rate expected for that hospital. A rate that is the "Same" or "Better" than expected signifies high-quality care.

This information is based on quality measures developed by the Agency for Healthcare Quality and Research (AHRQ), and made available by the Minnesota Hospital Association. This report is based on information from hospital patient medical records for services provided between October 2013 and September 2014

<b>Hospital</b>	<b>Pressure Ulcer Rate Compared to the Expected Rate</b>
Abbott Northwestern Hospital	Better than expected
Douglas County Hospital	Better than expected
Essentia Health - Duluth	Better than expected
Fairview Ridges Hospital	Better than expected
Fairview Southdale Hospital	Better than expected
