

Adult: Chlamydia screening - Obstetrics & Gynecology

Chlamydia is a common sexually transmitted disease (STD) which, left untreated, can damage a woman's reproductive organs. High quality health care includes a screening test for chlamydia in young women. Because the cervix (opening to the uterus) of teenage girls and young women is not fully mature, they are at higher risk for the disease if they are sexually active.

The bar charts and percentages below will tell you how successful Minnesota physicians and other health care providers are in helping young women get a screening test if they are sexually active.
